

## Pencil Sanding Trick

I don't know how many of you have had to try to figure out where two pieces of a model are rubbing and stopping the two pieces from going together properly. I was having a hard time figuring out where the two fuselage halves were rubbing and preventing a clean connection. So I used a pencil on the pieces where I thought it was rubbing, pushed the two halves together and I now have a pencil mark on the other piece where the part needs to be sanded...

You can see where on the model piece on the top of the photo where I rubbed my pencil and on the lower half in the lower part of the picture the residue of the pencil lead. Marking where I need to sand things down.
